

Application Name: RTIMNLD

Organization Name: Transavia

Enterprise Data Model Design and Governance Standards

1. All data models (data types) **must be created exclusively** within the **Rules** ruleset (**RTIMNLD-Rules**) to ensure consistency, reusability, and governance compliance.
 2. Data models **shall be designed strictly in accordance with approved business use cases**. Any deviation from documented requirements is not permitted without formal design approval.
 3. Property definitions, including naming conventions and data structures, **must exactly align with the corresponding use case specifications**. Variations may lead to functional or integration issues and must therefore be avoided.
 4. A dedicated dataset **must be created for each data model** and mapped to its respective class. Each dataset **must contain multiple keys**, which is mandatory for data integrity and efficient access.
 5. Upon completion of dataset creation, all datasets **must be registered as Profile Data Sources** within the **CDH Portal**, accessible via the **Data** section on the left-hand navigation panel.
 6. All registered datasets **shall be incorporated into the Profile Designer** within the **CDH Portal**, under the **Data** section, to enable unified customer profile configuration and decisioning.
